

My wife and I subscribe to XM satellite radio service and travel around the country in our motor home at least 7 months out of the year. We have found XM's wide variety of programming and instant traffic and weather reporting to be a highly valuable asset as we drive long distances across the country. We prize the ability to listen to programming styles of our choice consistently and for long periods of time, without interruptions posed by limited land based transmitter coverage areas or stations' often limited program dictates. We are strongly opposed to any attempt, as in the National Association of Broadcasters' petition 04-160, to restrict the ability of satellite radio to provide us with the programming variety we want and which we cannot get from traditional broadcasters, and urge the FCC to reject the NAB petition.
